# NEW Veeam Availability Orchestrator

Ensure business continuity and disaster recovery compliance

Enterprises face serious, and often complicated, challenges when it comes to the planning, preparation and execution of Always-On™ operations, no matter the scenario and with little time to spare. Mitigating risk against natural and man-made disasters — accidental or intentional — and ensuring business continuity is paramount to the organization's strategy and success. Manually documenting, testing and proving recoverability is difficult, error-prone and does not scale with the exponential growth of VMs, applications and services. This threatens not only data center resiliency, but also the ability to meet industry-governed compliance regulations.

NEW Veeam® Availability Orchestrator will solve these issues by providing organizations with a disaster recovery (DR) orchestration engine for Veeam Backup & Replication™ replicas. Automatically create, document and test DR plans that are fully prepared for C-level executive and stakeholder signoff and prove compliance with industry regulations and audits so you can:

- **Satisfy compliance requirements** with automated documentation that makes it easy to build and update the DR plan as the environment changes

- **Prove recoverability while reducing costs** through automated DR plan testing and readiness checks that avoid expensive manual processes with zero impact on production systems

- **Ensure IT service continuity** and minimize service disruption through orchestrated failover and failback of multi-site DR plans for planned migrations, disaster avoidance and disaster recovery
